Public Health Plans Experiment with Swine Flu Vaccine

August 10, 2009

What do human brain and nerve tissues, Gulf War Syndrome, some health supplements and GlaxoSmithKline's new swine flu vaccine adjuvant all have in common? The answer: *squalene*. Its presence in fatty tissues and supplements is generally benign or beneficial; its presence in GSK's vaccine is morbid.

GlaxoSmithKline holds the contract to supply Canada's pandemic H1N1 vaccine. GSK has indicated they want to use adjuvants in their vaccine, specifically the AS03 squalene based adjuvant.

According to a Canadian Press article, "**Canada will likely use adjuvanted swine flu vaccine, says Dr. David Butler-Jones, head of the Public Health Agency of Canada.** Neither Canada nor the U.S. has licensed flu vaccines containing adjuvants. So adding one would erect regulatory hurdles that would either require additional clinical trials - prolonging time to vaccine delivery - or a decision to use the product under "emergency use" authorizations."

A recent World Health Organization (WHO) Press Conference confirmed that squalene based adjuvants have not been tested in young children or pregnant women. Both are targeted groups on the priority list for injection, along with health care providers.

Adjuvants are immune boosting chemicals which allow smaller doses of the disease antigens to be used and would speed up the time it takes to produce enough vaccine for a country. When injected into the body, adjuvants provoke a powerful immune response not only to the disease particles being injected, but also stimulate the immune system to make antibodies against the adjuvant. Since squalene is an oil found naturally in the human body, an immune response of antibodies against the naturally occurring squalene already present in nerve cells can induce the immune system to wage war on its host. This type of aberrant immune system response is the basis of autoimmune diseases.

Autoimmune diseases typically take months and years to develop. Studies comparing the long term health outcome of groups injected with squalene, with those receiving traditional non-adjuvanted

vaccines have not been done. Without these comparative studies allowing for the typical time frame needed for the emergence of autoimmune diseases, a mass vaccination program with vaccines containing known hazardous substances like squalene is a reckless experiment by public health officials and governments who fund it.

Squalene was injected via an experimental anthrax vaccine into troops going to the Gulf War. Immunologist, Pamela Asa connected it with Gulf War Syndrome when she learned of a participant in a herpes vaccine trial who had received a squalene-based adjuvant as a placebo; he had subsequently developed autoimmune symptoms almost identical to Gulf War Syndrome. Dr Asa asked virologist, Robert Garry to develop a test to detect antibodies against squalene. That test has been the key diagnostic tool used to determine if patients' autoimmune diseases are linked to squalene in vaccines they have received.

Even as early as the 1930s, injected oils were notorious for inducing illness. They were considered much too dangerous for humans but were used to induce autoimmune disease in animals unfortunate enough to be undergoing lab tests. Experiments at UCLA and U of Florida Medical Schools, the Swedish Karolinska Institute, The Polish Academy of Science and many other research institutes have corroborated the powerful autoimmune-eliciting effects of squalene and squalene-based adjuvants specifically.

However, seeking vigorous immune boosting effects for vaccines showing poor efficacy, drug regulators have rashly ignored the decades-old evidence of harm. Research bodies have been developing vaccines containing squalene-based adjuvants for some time now, and some of these have already been marketed. One example is the Italian influenza vaccine, FLUAD, which was licensed in 1997. Although trials showed it to be safe for the elderly and safe over the short term, adverse events discovered post marketing and listed in the FLUAD monograph include diseases virtually the same as Gulf War Syndrome.

A noteworthy point to understand is that studies claiming it is safe to inject squalene into the human body are all sponsored by the pharmaceutical industry. However, the more than two dozen peer reviewed published studies documenting the health destructive effects of squalene as an injected adjuvant all reach a similar conclusion – **squalene typically induces a range of autoimmune diseases when injected into the body.**

Who will take responsibility when people are injured by this new experimental vaccine? Except for the province of Quebec, Canada has no compensation system for vaccine injury victims.

It's possible that delivery of the GSK 'pandemic' vaccine will be delayed so long that the public health experiment will be ditched. As Dr. Richard Schabas, MOH for Hastings and Prince Edward Counties, has said, most swine flu cases have been mild, the virus is already diminishing in the southern hemisphere and, "This is the fourth pandemic alarm in six years. And the first three have been wrong." Let's hope the squall blows over.
